

# THE EFFECTS OF AIR POLLUTION ON PLANT LIFE

## SLOWER GROWTH

When plants don't receive the right nutrients due to air pollution, they might grow slowly.

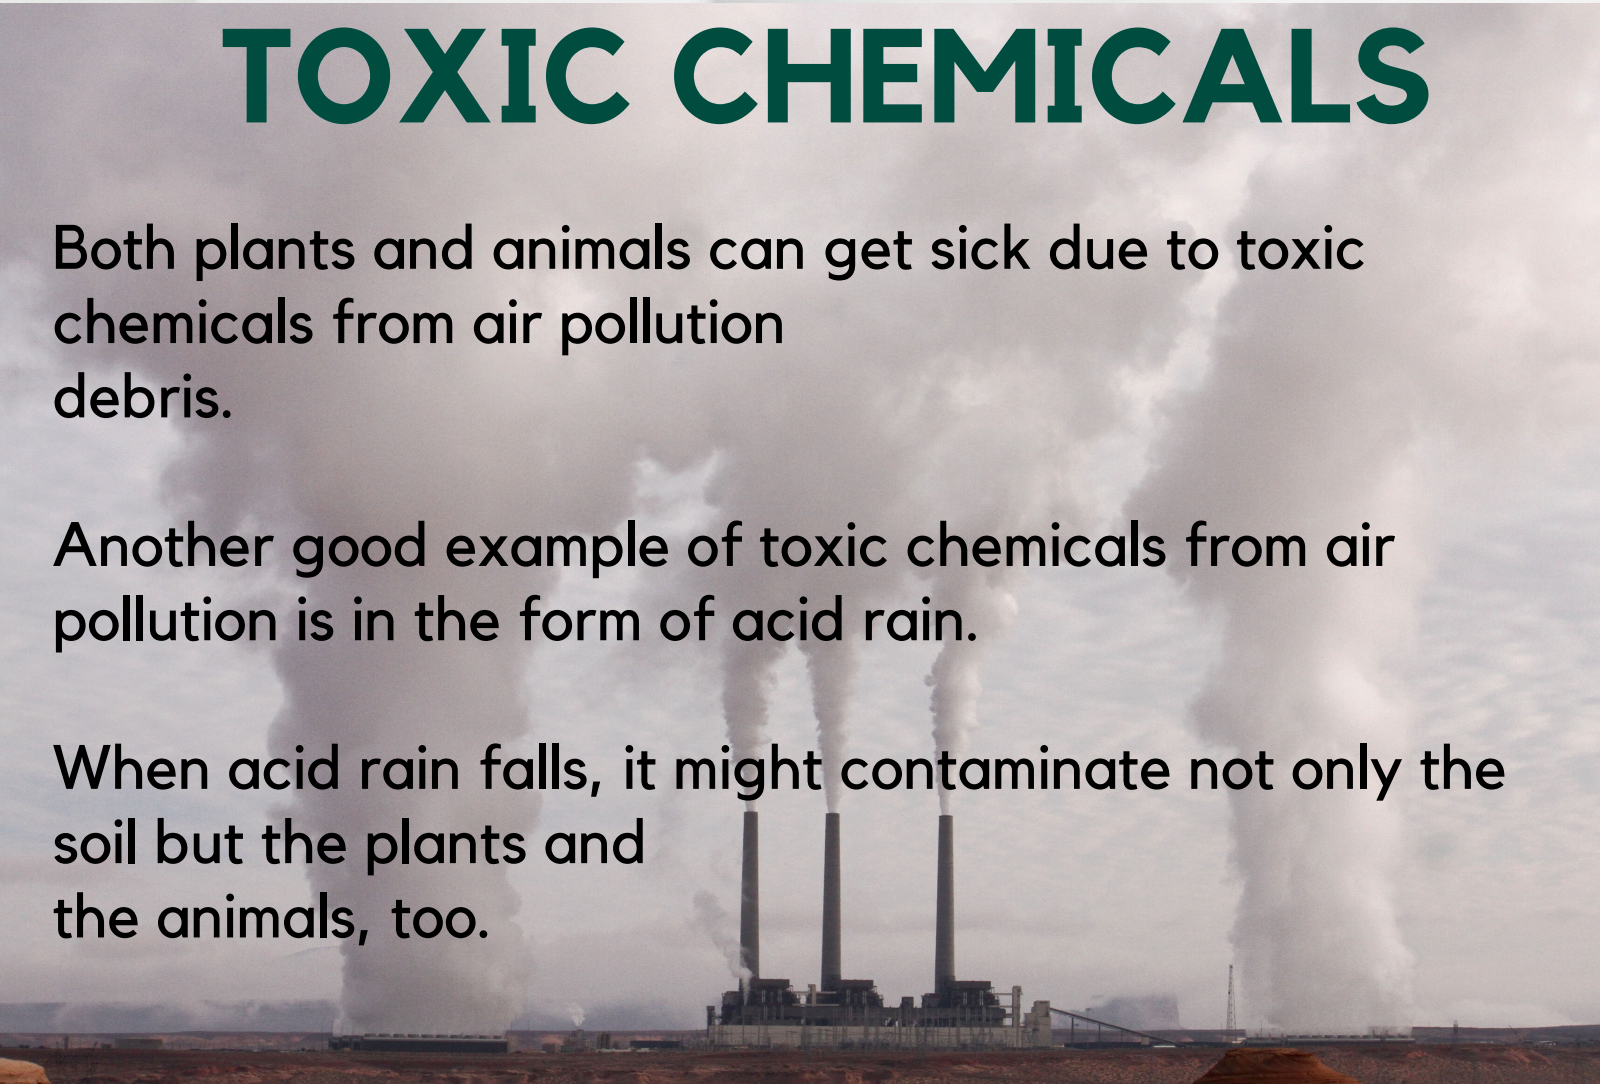

This has a domino effect on animals as well.

## TOXIC CHEMICALS

Both plants and animals can get sick due to toxic chemicals from air pollution debris.

Another good example of toxic chemicals from air pollution is in the form of acid rain.

When acid rain falls, it might contaminate not only the soil but the plants and the animals, too.

## FEWER RESOURCES

When plants die out of air pollution, most of our animals won't have food.

Some animals also use trees, leaves, and twigs for shelter. Without healthy plants, animals won't have decent shelters in the future.
